Program Objectives

The subject of Mechatronics is composed of the fields electrical- and mechanical engineering as well as computer science. The aim of the study program Master Mechatronics is to provide graduates with a solid and prevailing education in all three of these fields as well as the links between them. This goal can only be achieved on a satisfactorily level by taking into consideration the beforehand attained knowledge of the students, which is quite a unique feature of this study program.

Due to the versatility of the education, Mechatronic graduates are offered a vast profile of industrial sectors to work within, as well as lots of occupational profiles offered in these sectors. Some prominent examples of these industrial sectors are:

- Plant construction
- Robotics
- Environmental engineering
- Automotive industry: Safety systems; ADAS; Alternative drive systems
- Aerospace industry: Raising efficiency of vessels; Developing new propulsion systems; Increasing safety of air traffic
- Medicine technology: MRI machines; Dialysis machines; Nano technology
- Self-employment: Planning services; Counseling service

Due to the ongoing migration of electronic components toward 'classical' areas of engineering, also known as Cyber Physical Systems (CPS), an increasing demand of Mechatronic graduates is to be expected. According to VDI (Verein Deutscher Ingenieure) there are tens of thousands vacant positions in the field, with predicted number of graduates not being able to occupy all of these positions. The following occupational profiles apply to graduates of Master Mechatronics study program:

- Product developer
- Project manager
- Consultant
- Planning engineer
- Servicing engineer

All of these profiles apply to employed as well as self-employed graduates.

Connection of the modules

The following table shows the relationship of compulsory study modules offered in the course to fields of professional competences:

- Analytic and problem solving competence: Ability to professionally analyze questions of practice and development of proper and valuable solutions.
- Subject and methodical competence: Acquisition of a wide variety of methodic competences required in the field of Mechatronics.
- Self development: Self-reflection and ability to develop own notions regarding personal career.
- Social competence: Acquisition and consolidation of the required abilities which enable or alleviate coping with other people professionally. This includes the ability to chair different groups of interest.

A distinction between major and subsidiary impact of the respective module is made. As can be seen from the table, the majority of modules focuses on 'subject and methodical competence' and 'analytic and problem solving competence', which is to be expected for a technically-oriented study program. However, there are also modules in the study program to foster self development and social competence. The Scientific Project is a good example for such a module. Here, students are expected to work on a well-defined project in international teams with an emphasis on cooperation.

Implementation of RWU mission statement

The mission statements of RWU are closely reflected by the study program Master Mechatronics.

Since its creation, Master Mechatronics has been positioned as an international study program with the inherent goal of bonding together different cultures. This effort can be particularly observed through the Scientific Project module comprising said Scientific Project, which is to be conducted in international teams, as well as the accompanying seminar on intercultural sensitization. To further foster integration of different cultures, a broad range of language courses is offered. Education in the study program is in step with actual practice, tailored not only to the needs of the job market, which makes Master Mechatronic graduates highly sought-after in the latter, but also towards the prospective future of the graduates regarding further aspects. The study program is closely connected to local industries fostering possibilities like internships and final thesis', which are often career primers. Education is conducted in small groups, in a familiar manner. Most of the courses are taught in presence complemented by digital formats.

The study program emphasizes respectful and appreciative interaction between students and teachers. Students are also encouraged to positively influence the future of the study program through participation in the study committee. Apart from this, direct approach of professors is always possible.

Thesis

Lecture subjects Projects and internship

Applied Mathematics

Course of study:	Mechatronics (Master)
Degree:	Master of Science
Modul number:	01IN
Modul title:	Applied Mathematics
Module responsible:	Prof. Dr. rer. nat. Markus Schneider
Language of lecture:	english
Typ of module:	Mandatory module
Module Content:	Fundamentals Linear Systems Elimination Solution Sets Projections Orthogonality Eigenvalues and Eigenvectors Singular Value Decomposition
Courses:	10791 Applied Mathematics
Teaching and learning forms:	Lecture and tutorial/lab session
Prerequisites for participation:	College Level Calculus and Linear Algebra You should be comfortable taking derivatives and understanding matrix vector operations and notation.
Applicability of the module:	The techniques, especially numerical methods, are of big relevance for all engineers who work in research and development. Whenever mathematical models are used, numerics is relevant. Thus, this course is essential whenever mathematical models come into play.
Prerequisites allocation ECTS:	K90
ECTS credits:	5
Grading:	graded
Workload:	The workload for the module is approx. 150 hours, of which 60 hours are for lectures and 180 hours for self-study (preparation and follow-up work, exam preparation). This results in an assessment of 5 ECTS points.
Duration of the module:	one semester
Frequency of offering:	Winter semester only
Literature:	Strang, Gilbert. Introduction to linear algebra. Wellesley-Cambridge Press, 2022. Bartholomew-Biggs, Michael. Nonlinear optimization with engineering applications. Vol. 19. Springer Science & Business Media, 2008. Bertsekas, Dimitri, and John N. Tsitsiklis. Introduction to probability. Vol. 1. Athena Scientific, 2008.
Compulsory attendance:	no

Competence dimensions Applied Mathematics

Knowledge and understanding: Deepening of individual components of knowledge

After successfully attending this course, the graduates are able to solve mathematical problems arising in typical engineering tasks. Primary focus is on numerically solving nonlinear problems and on the statistical interpretation of results from measurements. In numerical mathematics, the focus is put on methods for function approximation from data, solution of equations, and integration.

Use, application and generation of knowledge/art: Use and transfer

The graduates are able to work successfully on the exercises.

Communication and cooperation

Numerical Methods

Course of study:	Mechatronics (Master)
Degree:	Master of Science
Modul number:	02IN
Modul title:	Numerical Methods
Module responsible:	Prof. Dr. rer. nat. Markus Schneider
Language of lecture:	english
Typ of module:	Mandatory module
Module Content:	Fundamentals Unconstrained Descent Methods Convex Optimization Constrained Optimization Nonsmooth Optimization
Courses:	10790 Numerical Methods
Teaching and learning forms:	Lecture and tutorial/lab session
Prerequisites for participation:	College Level Calculus and Linear Algebra You should be comfortable taking derivatives and understanding matrix vector operations and notation
Applicability of the module:	The techniques, especially numerical methods, are of big relevance for all engineers who work in research and development. Whenever mathematical models are used, numerics is relevant. Thus, this course is essential whenever mathematical models come into play.
Prerequisites allocation ECTS:	K90
ECTS credits:	5
Grading:	graded
Workload:	A workload of 15 hours per ECTS is assumed. This results in a workload of 150 hours.
Duration of the module:	one semester
Frequency of offering:	Winter semester only
Literature:	Strang, Gilbert. Introduction to linear algebra. Wellesley-Cambridge Press, 2022. Bartholomew-Biggs, Michael. Nonlinear optimization with engineering applications. Vol. 19. Robotics

Course of study:	Mechatronics (Master)
Degree:	Master of Science
Modul number:	10IN
Modul title:	Robotics
Module responsible:	Prof. Dr. rer. nat. Markus Schneider/Benjamin Stähle
Language of lecture:	english
Typ of module:	Compulsory elective module
Module Content:	The module Robotics will give interested students an introduction to the state of the art in robotics. This includes mobile systems as well as manipulators for indoor and outdoor use. Manipulators: History, Types of Robots, Applications, Social Impact Kinematic: Homogeneous Transformation, Euler-Angles, Quaternions, DH-Parameter, Forward-Backward Kinematic Robot-Movements: Trajectories, Collision Detection Dynamics: Principle-Virtual Work, Iterative Newton-Euler, Luh-Walker-Paul Position Control Programming: Languages, Online/Offline, Control-Panel Mobile Robotics: In this lecture the basics for the definition and handling of mobile robotics will be explained. This includes AUVs, UUVs and UGVs with a focus on UGVs. Beside real world examples the general technologies for the development of mobile systems will be introduced and explained. Therefore the following topics are handled during the lecture: description of platforms of mobile robots (kinematic and dynamic models) possible sensors for mobile systems communication for mobile systems (inter robot communication, local on board communication and communication with the control station) self localization automatic generation of maps based on sensor data algorithms for collision avoidance
Courses:	Robotics Lab on Robotics
Teaching and learning forms:	Lecture / practical training (laboratory)
Prerequisites for participation:	MOBILE ROBOTICS: - knowledge about geometry and matrix operations - basics in physics - control theory basics Robotics Lab: Basics in programming, robotics lecture or adequate previous knowledge.

Applicability of the module:	Mechatronics Electrical Engineering and Embedded Systems Informatik
Prerequisites allocation ECTS:	Written examination, 90 minutes
ECTS credits:	7
Grading:	graded
Workload:	30h / 1 ECTS
Duration of the module:	one semester
Frequency of offering:	Summer semester only

Compulsory attendance:	no

Competence dimensions Robotics

Knowledge and understanding: Deepening of individual components of knowledge

Graduates have deepened and widened their knowledge in the following areas and may reflect that knowledge:

- -Fields of application
- -Challenges with the deployment of robots and different possibilities of path planning
- -Composition of robot structures and dynamic simulation of a robot
- -Moving Kuka robots in different ways and establishing coordinate systems
- -Programming of Kuka robots and simulation of a robot cell with Kuka-SimPro
- -Solving automation tasks with the help of industrial robots and programming a simple mobile robot

Use, application and generation of knowledge/art: Use and transfer

Knowledge of the following fields can be practically applied by graduates:

- -Solving the inverse problem for a 6-axis robot
- -Describing 3D systems with the help of homogenous transformation matrices and solving simple automation tasks with the help of a robot

Communication and cooperation

Advanced Control Systems

Course of study:	Mechatronics (Master)
Degree:	Master of Science
Modul number:	EMM03
Modul title:	Advanced Control Systems
Module responsible:	Prof. DrIng. Lothar Berger
Language of lecture:	english
Typ of module:	Mandatory module
Module Content:	Attendees are first given an introduction to analysis and modeling of dynamic systems - electrical, mechanical, and thermal. Then, design and optimization of single and multiple stage digital PID control is presented, as well as single-input and multi-input state control - without and with observer, optimal control, and model-predictive control. Finally, adaptive control methods are illustrated; based upon recursive parameter estimation, and neural nets. Within the complementary lab, attendees are educated to choose and implement suitable digital control methods for given dynamic systems - like mixer tank setup and balanced beam setup - utilizing computer-based tools like MATLAB/Simulink; as C programmed algorithms.
Courses:	Advanced Control Systems Advanced Control Systems Lab
Teaching and learning forms:	Lecture; Lab - or - E-Learning: Lessons, Exercises; Homework: Practical work
Prerequisites for participation:	Applied Mathematics Numerical Methods
Applicability of the module:	Embedded Control, Simulation of Mechatronic Systems, Integration of Mechatronic Systems, Robotics, Research Project, Master Thesis
Prerequisites allocation ECTS:	K90: Written examination; 90 minutes
ECTS credits:	6
Grading:	graded - Lab attendance documented by not graded lab report is required for admission to exam
Workload:	Presence: 72h, Self-study: 108h - or - Online: 48h, Self-study: 108h, Homework: 24h
Duration of the module:	one semester
Frequency of offering:	Summer semester only

Compulsory attendance:	no

Competence dimensions Advanced Control Systems

Knowledge and understanding: Deepening of individual components of knowledge

Attendees learned about models of dynamic systems - electrical, mechanical, and thermal - and both classical control methods, like digital PID control, and advanced control methods, like state control without/with observer, model-predictive control, and adaptive control.

Use, application and generation of knowledge/art: Scientific innovation

Attendees learned to characterize, model, and simulate dynamic systems - electrical, mechanical, and thermal - and choose and implement suitable digital control methods, from both established methods, like digital PID control, and advanced methods, like state control without/with observer, optimal control, model-predictive control, and adaptive control. Attendees learned to assess these digital control methods, regarding effort, safety, and cost-effectiveness; and how to implement these, utilizing computer-based tools like MATLAB/Simulink; as C programmed algorithms. Through the complementary lab, attendees learned to choose and implement suitable digital control methods for given dynamical systems; like mixer tank setup and balanced beam setup.

Communication and cooperation

Attendees learned about presenting and applying advanced digital control methods as a systems science; aimed at interdisciplinary projects; operated within a team of scientists, engineers, designers, and economists.

Scientific / artistic self-image and professionalism

Attendees learned about economical and ecological considerations in choosing, implementing, and optimizing advanced digital control methods for industrial processes.

Embedded Computing 1

Course of study:	Mechatronics (Master)
Degree:	Master of Science
Modul number:	EMM05
Modul title:	Embedded Computing 1
Module responsible:	Prof. Dr. rer. nat. Markus Pfeil
Language of lecture:	english
Typ of module:	Mandatory module
Module Content:	- Embedded Systems in motor management, ABS, medical devices and its increasing programming needs Modeling of embedded systems (Cyber-Physical Systems) - Functions of 32-bit micro controllers (ARM), interface functions, its programming under Linux - Implementation of operating systems on microcontrollers
Courses:	Embedded Computing
Teaching and learning forms:	Lecture and Laboratory / practical course and Project Lecture with integrated applications, development and programming of functions for embedded systems, project management (project idea, realization, presentation)
Prerequisites for participation:	Bachelor knowledge
Applicability of the module:	Electrical Engineering and Embedded Systems Mechatronics
Prerequisites allocation ECTS:	PF PF
ECTS credits:	5
Grading:	graded
Workload:	5 ECTS Embedded Computing 150 h (60 h Lecture, 90 h Homework)
Duration of the module:	one semester
Frequency of offering:	Winter semester only
Literature:	B. P. Douglas; "Real-Time UML", Second Edition. Addision Wesley Longman, Inc., 2000. P. Marwedel; "Embedded System Design", Springer Verlag, 2006. D. Abbott; "Linux for Embedded and Real-time Applications", Elsevier Science, 2003
Compulsory attendance:	no

Competence dimensions Embedded Computing 1

Knowledge and understanding: Knowledge Comprehension

The graduates have broadened their knowledge in the following fields and are capable of reproducing this knowledge:

- Mechatronic and electrical engineering
- Model and simulate mechatronic systems
- Construct electrical and IT components

Use, application and generation of knowledge/art:

Communication and cooperation

With the contents for the module, sustainable work, design and economics will be teached. It will be improved to a level, that it fits to the needs of companies. The intercultural competence of the graduates will be developed by

- international tandem teams
- mixed teams in the labs
- mixed teams for projects and seminars

Scientific / artistic self-image and professionalism

In the course of their study, the graduates have already reached a level of knowledge and understanding that enables them to analyze not only simple but also complex interactions. On this basis, they are capable of independently identifying scientific or practice-related issues in the following fields:

- mechatronic questions
- model and simulate mechatronic systems
- construct electrical and IT components
- present mechatronic projects

Embedded Computing 2

Course of study:	Mechatronics (Master)
Degree:	Master of Science
Modul number:	EMM06
Modul title:	Embedded Computing 2
Module responsible:	Prof. Dr. rer. nat. Markus Pfeil
Language of lecture:	english
Typ of module:	Mandatory module
Module Content:	- Embedded Systems in motor management, ABS, medical devices and its increasing programming needs Modeling of embedded systems (Cyber-Physical Systems) - Functions of 32-bit micro controllers (ARM), interface functions, its programming under Linux - Implementation of operating systems on microcontrollers

Electrical Drives

Course of study:	Mechatronics (Master)
Degree:	Master of Science
Modul number:	MM02
Modul title:	Electrical Drives
Module responsible:	Prof. DrIng. László Farkas
Language of lecture:	english
Typ of module:	Mandatory module
Module Content:	Introduction: -Fundamental equations; -energies, forces, powers. DC machine: -mechanics, equivalent circuit, main equations; - types of machines, variable supply voltage; -application in drives, operating range, risks. AC machine: -Fundamentals of transformer: equations for AC machine; -Electrical machine: equivalence to rotating transformer; -torque, power; -operating range, fundamental understanding. Induction machine: -mechanics, equivalent circuit; -(rotor) resistance, inductances; -heyland circle, Kloss formula; - operation modes, controling; -application in drives, risks, construction. Synchronous machine: -mechanics, equivalent circuit, phasor diagram; -field oriented control, analogon to dc machine. Permanent Magnet Synchronous Machine (PMSM): -mechanics, equations, phasordiagram; -effect of reluctance; - mechanical specialities; -rotordesign. Brushless DC-Motor (BLDC): -application in drives; -advantages/disadvantages in relation to normal synchronous machine. Field of application: -powertrain in hybrids and e-drives; -application for fulldrives or auxiliary drives; -costs versus necessity; -comparison of force densities.
Courses:	Electrical Drives
Teaching and learning forms:	Lecture
Prerequisites for participation:	Principles of electrical engineering
Applicability of the module:	Mechatronics; Electrical Engineering and Embedded Systems
Prerequisites allocation ECTS:	Written examination, 90 minutes.
ECTS credits:	5
Grading:	benotet
Workload:	30h / 1ECTS
Duration of the module:	one semester
Frequency of offering:	Winter semester only

Ino

Competence dimensions Electrical Drives

Knowledge and understanding: Broadening of prior knowledge

The lecture gives an overview together with formulas of the most important electrical machines in the application for drives. The graduates are able to describe the function of these most used electrical machines and drives together with the necessary control in the drive and give application-hints and examples.

Use, application and generation of knowledge/art:

Communication and cooperation

Power Electronics

Course of study:	Mechatronics (Master)
Degree:	Master of Science
Modul number:	MM03
Modul title:	Power Electronics
Module responsible:	Prof. DrIng. László Farkas
Language of lecture:	english
Typ of module:	Mandatory module
Module Content:	Based on a modern Power Electronics device for electrical drives the main structure and the most important components will be discussed. Especially an introduction to the power semiconductors with their characteristic curves will be given. In the next step the classical circuits are discussed with their main application including the (dis-)advantages: without commutation, commutation by circuit / by network, self commutation. Also an introduction to the possible operation quadrants, their triggering and the harmonics in general is given. Especially the modern vector control (voltage space-vector) will be discussed in detail for the example of the synchronous machine. Finally, a prospect will be given to the most important electrical machines for e-drives with the focus to the used power electronics.
Courses:	Power Electronics
Teaching and learning forms:	Lecture
Prerequisites for participation:	Principles of electrical engineering
Applicability of the module:	Mechatronics
Prerequisites allocation ECTS:	K90
ECTS credits:	5
Grading:	graded
Workload:	30h / 1 ECTS
Duration of the module:	one semester
Frequency of offering:	Winter semester only

Compulsory attendance:	no

Competence dimensions Power Electronics

Knowledge and understanding: Deepening of individual components of knowledge

The students have deepened their existing knowledge in the following areas and are capable of not only reproducing the corresponding contents but also of explaining them. They understand the underlying principles, the whys and wherefores:

- -valution of structure of modern power electronics and the interaction of most important components,
- -analyze of the used components,
- -comparison of concepts.

Use, application and generation of knowledge/art:

Communication and cooperation

Engineering Design and Materials

Course of study:	Mechatronics (Master)
Degree:	Master of Science
Modul number:	MM04
Modul title:	Engineering Design and Materials
Module responsible:	Prof. DrIng. Michael Niedermeier
Language of lecture:	english
Typ of module:	Mandatory module
Module Content:	 design methodology in mechatronical product development selection of materials: steel, light-metals, plastics, ceramics, composites smart materials and lightweight structures corrosion joining technologies selected machine elements compliant mechanisms life cycle assessment of mechatronical products
Courses:	Engineering Design and Materials
Teaching and learning forms:	V + Ü; lecture/team exercises/student presentations
Prerequisites for participation:	completed bachelor's degree in engineering or natural sciences
Applicability of the module:	Scientific Project; Master Thesis
Prerequisites allocation ECTS:	Written examination, 90 minutes.
ECTS credits:	5
Grading:	graded
Workload:	30h / 1 ECTS
Duration of the module:	one semester
Frequency of offering:	Winter semester only
Literature:	Newest edition in each case: Grote KH., Hefazi H., et al., Springer Handbook Mechanical Engineering, chapter Engineering Design, Springer. Ashby M., Materials Selection in Mechanical Design, Elsevier. Ashby M., Shercliff H., Cebon D., Materials, Elsevier
Compulsory attendance:	no

Competence dimensions Engineering Design and Materials

Knowledge and understanding: Deepening of individual components of knowledge

Graduates discuss current material developments, material combinations in mechatronics. They deepen the systematic approach of mechatronic product development at a high scientific level and expand it in selected areas. Graduates are able to assess a wide range of materials and material effects on the environment (life cycle). They are able to grasp materials science as a complex topic and to combine knowledge from different areas of materials technologies. Graduates can dimension selected machine elements and apply them in mechatronics.

Use, application and generation of knowledge/art: Use and transfer

The most important materials can be selected and used to design a mechatronical product. The graduates are able to calculate and design the mechanical parts of a mechatronical product. To gain a practice related understanding on the subject of corrosion, tribology and surface technology together with user related know how on important types of metals.

Communication and cooperation

The students discuss justifiable solutions to problems with the lecturer in a subject-related manner.

Scientific / artistic self-image and professionalism

Students recognise the framework conditions of professional action and reflect responsibly on decisions in mechatronics product development.

Advanced Engineering Mechanics

Course of study:	Mechatronics (Master)
Degree:	Master of Science
Modul number:	MM05
Modul title:	Advanced Engineering Mechanics
Module responsible:	Prof. DrIng. Ralf Stetter
Language of lecture:	english
Typ of module:	Mandatory module
Module Content:	This lecture consolidates highly specialized knowledge of engineering mechanics as basis for theoretical and applied research. Special chapters from the areas statics, mechanics of materials, kinematics, kinetics, and dynamics are presented in the lecture and are consolidated by means of tutorials in form of exercises. Through this specialized problem solving qualifications for the development of new calculation methods are acquired. The subject matter taught additionally serves as a basis for the application of the finite element method.
Courses:	Advanced Engineering Mechanics
Teaching and learning forms:	Variant A) Lecture; Variant B) E-Learning with accompanying shortened lecture
Prerequisites for participation:	Knowledge of mathematics
Applicability of the module:	Mechatronics; Electrical Engineering and Embedded Systems
Prerequisites allocation ECTS:	Written examination, 90 minutes.
ECTS credits:	5
Grading:	graded
Workload:	Variant A) Lecture: 45 h presence; 105 h self-study Variant B) E-Learning with accompanying shortened lecture: 22,5 h presence; 127,5 h self-study
Duration of the module:	one semester
Frequency of offering:	Winter semester only
Literature:	-Dankert&Dankert: Technische Mechanik: Statik, Festigkeitslehre, Kinematik/Kinetik. Vieweg Teubner Verlag; 2013Hibbeler: Statics&Dynamics. MACMILLAN Gross, D.; Hauger, W.; Schröder, J.; Wall, W.A.; Rajapakse, N.: Engineering Mechanics 1 – Statics; Springer; 2013 Gross, D.; Hauger, W.; Schröder, J.; Wall, W.A.; Bonet, J.: Engineering Mechanics 2 – Mechanics of Materials; Springer; 2018 Gross, D.; Ehlers, W.; Wriggers, P.; Schröder, J.; Müller, R.: Statics – Formulas and Problems. Springer; 2017 Gross, D.; Ehlers, W.; Wriggers, P.; Schröder, J.; Müller, R.: Mechanics of Materials – Formulas and Problems. Springer; 2017.
Compulsory attendance:	no

Competence dimensions Advanced Engineering Mechanics

Knowledge and understanding: Broadening of prior knowledge

The graduates can explain the basics of engineering mechanics (statics, mechanics of materials, kinematics, kinetics, and dynamics) which are also the basis for theoretical and applied research. The graduates can explicate the fundamental equations of engineering mechanics which also serve as a basis für the application of the finite element method.

Use, application and generation of knowledge/art: Use and transfer

The graduates can solve problems in the context of statics, mechanics of materials and dynamics. They are be able, on the one hand, to calculate the rigidity, stiffness, stresses and so on of even complicated components and to analyze even complex mechanisms dynamically, on the other hand also to play an active role in the advancement of the research field "mechanics".

Communication and cooperation

Process Interface Equipment

Course of study:	Mechatronics (Master)
Degree:	Master of Science
Modul number:	MM07
Modul title:	Process Interface Equipment
Module responsible:	Prof. DrIng. Raphael Ruf
Language of lecture:	english
Typ of module:	Mandatory module
Module Content:	 Introduction and overview of industrial automation systems; System interfaces to field elements (binary, digital, analog and signal adaption); Sensor principles and example devices; Actuators; Operational amplifiers; ADC- and DAC converters; Linearisation Lab tests: Intelligent contactor turning on / off Ohmic inductive load (Identification of R, L, and C of load, non-linear behaviour of L, over Voltage protection) Basic measurements using the oscilloscope and multimeter Temperature measurement by TC, RTD and and pyroelectric sensor (Identify type of sensor, Parameter Identification of dynamic model Pt1-Tt, Limits of linear behaviour of different type of measurement amplifiers) Characteristics of intelligent position sensors (Limit switches, inductive sensor, capacitive sensor, 2/3 wire interface, switching distance)
Courses:	Process Interface Equipment; Laboratory on Process Interface Equipment
Teaching and learning forms:	Lecture + Practical training
Prerequisites for participation:	-Basic mathematical knowledge; -Basic physical knowledge; -Basic electrical engineering knowledge; -Successful participation of the examination is necessary for attending the lab.
Applicability of the module:	Master Mechatronics
Prerequisites allocation ECTS:	Written examination, 90 minutes. Successful participation of Process Interface Equipment Laboratory
ECTS credits:	5 successful examination, 2 successful laboratory participation
Grading:	graded
Workload:	30h / 1 ECTS
Duration of the module:	one semester
Frequency of offering:	Winter semester only

Compulsory attendance:	no

Competence dimensions Process Interface Equipment

Knowledge and understanding: Deepening of individual components of knowledge

Graduates are able to name and explain components of an automation system which are closely related to the respective technical process. Focus is on sensors as well as actuators and their interfacing to the automation system.

Graduates are capable of designing and simulating measurement amplifiers using operational amplifiers.

Graduates have a solid knowledge of the most common wiring techniques found in automation systems.

Use, application and generation of knowledge/art: Use and transfer

Graduates are capable of applying the knowledge they have acquired in the following fields:

- Wiring of up-to-date process components to the respective automation computer.
- Theoretical and practical experience concerning intelligent sensors and actuators of industrial process interface equipment.
- Designing of measurement amplifiers and signal adaption units.

Communication and cooperation

Simulation of Mechatronic Systems

Course of study:	Mechatronics (Master)
Degree:	Master of Science
Modul number:	MM08
Modul title:	Simulation of Mechatronic Systems
Module responsible:	Prof. DrIng. Konrad Wöllhaf
Language of lecture:	english
Typ of module:	Mandatory module
Module Content:	• Introduction; • Model Forms; • Simulation Algorithms; • Simulation in Practice; • Applications; • Component Models; • HIL / Co-Simulation
Courses:	Simulation of Mechatronic Systems
Teaching and learning forms:	Lecture
Prerequisites for participation:	-Mathematics; -Basics of control theory
Applicability of the module:	Mechatronics; Computer science
Prerequisites allocation ECTS:	Written examination, 90 minutes.
ECTS credits:	5
Grading:	graded
Workload:	30h / 1 ECTS
Duration of the module:	one semester
Frequency of offering:	Winter semester only
Literature:	Angermann, A.; Beuschel, M.; Rau, M. & Wohlfarth, U. (2002), Matlab-Simulink – Stateflow De Gruyter Oldenbourg, 2021 Angermann, A.; Beuschel, M.; Rau, M. & Wohlfarth, U. (2001), Introduction to Physical Modeling with Modelica, Kluwer Academic Publishers Group. www.hs-weingarten.de/~woellhaf
Compulsory attendance:	no

Competence dimensions Simulation of Mechatronic Systems

Knowledge and understanding: Deepening of individual components of knowledge

Graduates have deepened and widened their knowledge in the following areas and may reflect that knowledge:

- -Challenges of a simulation project
- -Different simulation methods
- -Challenges arising with HIL-simulations

Use, application and generation of knowledge/art: Use and transfer

Knowledge of the following fields can be practically applied by graduates:

- -Organizing a simulation project
- -Choosing and applying suitable simulation methods and algorithms
- -Modeling dynamic systems and describing them with explicit differential equations of first order
- -Applying Matlab to solve everyday calculation tasks in engineering practice
- -Implementing and simulating ODE-systems with Matlab and Simulink

Gradates are be able, on the one hand, to calculate the rigidity and stiffness even of complicated components and to analyze complex mechanisms dynamically, on the other hand also to play an active role in the advancement of the research field.

Communication and cooperation

Scientific Project

Course of study:	Mechatronics (Master)
Degree:	Master of Science
Modul number:	MM09
Modul title:	Scientific Project
Module responsible:	Prof. DrIng. Raphael Ruf
Language of lecture:	english
Typ of module:	Mandatory module
Module Content:	 Project in the field of Mechatronics to be conducted at the RWU. Providing the essential tools necessary to understand different cultures. Training participants' usage of the given tools in various cross cultural scenarios and teams. Finding a common understanding of what a team comprises of, which is shared by all participants. Being aware of communication und language problems within the participants. Clarifying the goals and rules of the project teams for effective co-operation. Finding constructive and neutral ways of dealing with conflict. Understanding functions, targets, roles and expectations of each team member. Integrating a permanent intercultural learning process for the future.
Courses:	Working in international scientific project teams seminar Scientific Project
Teaching and learning forms:	Seminar and Project
Prerequisites for participation:	None
Applicability of the module:	Mechatronics
Prerequisites allocation ECTS:	-Scientific project report -Scientific project presentation -Seminar paper
ECTS credits:	Scientific Project: 5 Working in international scientific project teams seminar: 1
Grading:	graded
Workload:	30h per 1 ECTS
Duration of the module:	one semester
Frequency of offering:	Every semester
Literature:	Depends on the chosen project.
Compulsory attendance:	no

Competence dimensions Scientific Project

Knowledge and understanding:

Use, application and generation of knowledge/art: Scientific innovation

In the course of their study, the graduates have already reached a level of knowledge and understanding that enables them to analyze not only simple but also complex interactions. On this basis, they are capable of independently identifying scientific or practice-related issues. They can also develop solutions to problems for the following complex issues and thus make a contribution to the further development of science/society/practice: Independent working on the field of mechatronics.

Communication and cooperation

The graduates are capable of communicating effectively. By attending the module, they have improved their communicative skills in the following fields (technical/general/foreign language): To develop a process of learning that encourages intercultural understanding and tolerance amongst the participants. To effectively work in teams by enhancing each team member's contribution in successfully completing a scientific project.

Automation

Course of study:	Mechatronics (Master)
Degree:	Master of Science
Modul number:	MM11
Modul title:	Automation
Module responsible:	Prof. DrIng. Raphael Ruf
Language of lecture:	english
Typ of module:	Mandatory module
Module Content:	 Fields of automation Microcontroller characteristics ARM Cortex M4 architecture by example of STM32 devices Basic programming of STM32 MCUs Software patterns for programming embedded systems
Courses:	Automation
Teaching and learning forms:	Lecture with programming exercises conducted in the laboratory
Prerequisites for participation:	Knowledge in basic electrical engineering. Basic knowledge of C or any other programming language.
Applicability of the module:	Mechatronics Electrical Engineering
Prerequisites allocation ECTS:	Klausur 90 Minuten
ECTS credits:	5
Grading:	graded
Workload:	30h per 1 ECTS
Duration of the module:	one semester
Frequency of offering:	Summer semester only
Literature:	Noviello, C.: Mastering STM32 Mazidi, M.: STM32 Arm Programming for Embedded Systems Amos, B.: Hands-on RTOS with Microcontrollers Yiu, J.: The Definite Guide to Cortex M3 and M4 Processors Gannsle, J.: The Art of Designing Embedded Systems Pont, M.: Patterns for Time-Triggered Embedded Systems Prinz, P.: C in a Nutshell
Compulsory attendance:	no

Competence dimensions Automation

Knowledge and understanding: Broadening of prior knowledge

Graduates can give an overview over the different fields of automation and are able to judge which automation computer is suitable respectively. They have knowledge about the most important microcontroller characteristics and a solid up-to-date market overview.

Graduates have a solid understanding of the ARM Cortex M4 architecture and further microcontroller peripheral features using the example of STM microcontrollers. Graduates know about fundamental software patterns used in product automation. They are able to match a suitable pattern to requirements.

Use, application and generation of knowledge/art: Use and transfer

Due to up-to-date market overview obtained from attending the module, graduates can choose the most appropriate microcontroller for their actual task at hand. This serves economic as well as ecological (reduced energy consumption and or battery operation) purposes.

With the software patterns learned in this module, graduates may lay the successful foundation of developing electronic embedded products. Thanks to using proven patterns, chances of entering a dead-end in the developing cycle are reduced to a minimum.

Communication and cooperation

Special Module

Course of study:	Mechatronics (Master)
Degree:	Master of Science
Modul number:	MM13
Modul title:	Special Module
Module responsible:	Prof. DrIng. Raphael Ruf
Language of lecture:	english
Typ of module:	Compulsory elective module
Module Content:	dependent on chosen module
Courses:	Elective modules are shown in tables 1-4 of the SPO, depending on your prior education. Then, the respective module records of said module(s) in the module handbook will apply.
Teaching and learning forms:	dependent on chosen module
Prerequisites for participation:	dependent on chosen module
Applicability of the module:	dependent on chosen module
Prerequisites allocation ECTS:	dependent on chosen module
ECTS credits:	dependent on chosen module
Grading:	dependent on chosen module
Workload:	dependent on chosen module
Duration of the module:	one semester
Frequency of offering:	Every semester
Literature:	dependent on chosen module
Compulsory attendance:	no

Competence dimensions Special Module

Knowledge and understanding:

dependent on chosen module

Use, application and generation of knowledge/art:

Master-Thesis

Course of study:	Mechatronics (Master)
Degree:	Master of Science
Modul number:	MM15
Modul title:	Master-Thesis
Module responsible:	Prof. DrIng. Raphael Ruf
Language of lecture:	english
Typ of module:	Mandatory module
Module Content:	Students should prove their knowledge gained from theoretical and practical lectures on an engineering project or a research transaction. Working methodology shall be tailored to the needs of the employer, including sustainability, design and economic aspects.
Courses:	-Master Thesis activity -Master Thesis report -Master Thesis colloquium
Teaching and learning forms:	Engineering and/or research experience
Prerequisites for participation:	In order to be entitled to begin the Master Thesis, candidates need to have gained at least 45 ECTS from the modules of semesters MM1 and MM2.
Applicability of the module:	Mechatronics
Prerequisites allocation ECTS:	-Delivery of Master Thesis report -Presentation of the results in a colloquium public to all members of the university.
ECTS credits:	25
Grading:	The Master Thesis shall have a duration of 6 months. It will be assessed and graded by two professors one of whom is lecturing at the Hochschule Ravensburg-Weingarten – University of Applied Sciences.
Workload:	30h per 1 ECTS
Duration of the module:	one semester
Frequency of offering:	Every semester
Literature:	Largely subject dependent.
Compulsory attendance:	no

Competence dimensions Master-Thesis

Knowledge and understanding:

Students are able to define, work on, evaluate and explain scientific topics.

Use, application and generation of knowledge/art:

Students are able to define, work on, evaluate and explain scientific topics.

Communication and cooperation

Scientific / artistic self-image and professionalism

The Master Thesis is an accredited examination which shall prove the candidate's ability to solve problems and work on a topic from the subject matter of his major field of study within a specified period of time using adequate methods.
